

NEW CRITICAL VULNERABILITY ADVISORY: CVE-2026-50515

Summary

CVE-2026-50515 is a newly disclosed Critical vulnerability. It is not yet on CISA's actively-exploited list; treat it as proactive patching before it is weaponised. Deserialization of untrusted data in Azure Service Bus allows an authorized attacker to execute code over a network.

What we know

- **CVE:** CVE-2026-50515
- **Status:** Newly disclosed, not yet known-exploited (not on CISA KEV)
- **Severity:** CVSS 9.9 Critical, Network-exploitable, no user interaction (CVSS:3.1/AV:N/AC:L/PR:L/UI:N/S:C/C:H/I:H/A:H)

Recommended action

Patch as a fix becomes available, prioritised by the exposure and EPSS above. Until then, limit network exposure of the affected service and tighten access until patched. This does not yet trigger CRA 24-hour reporting, which requires active exploitation, but patching ahead of exploitation is the whole point.
