

NEW CRITICAL VULNERABILITY ADVISORY: CVE-2026-62836

Summary

CVE-2026-62836 is a newly disclosed High vulnerability. It is not yet on CISA's actively-exploited list; treat it as proactive patching before it is weaponised. Improper restriction of communication channel to intended endpoints in Azure SQL Managed Instance allows an unauthorized attacker to elevate privileges over a network.

What we know

- **CVE:** CVE-2026-62836
- **Status:** Newly disclosed, not yet known-exploited (not on CISA KEV)
- **Severity:** CVSS 8.7 High, Network-exploitable, no privileges required, no user interaction (CVSS:3.1/AV:N/AC:H/PR:N/UI:N/S:C/C:H/I:H/A:N)
- **Exploitation likelihood (EPSS):** 0%

Recommended action

Patch as a fix becomes available, prioritised by the exposure and EPSS above. Until then, restrict network access to the affected service now (segment it, put it behind a VPN, or take it offline) until you can patch. This does not yet trigger CRA 24-hour reporting, which requires active exploitation, but patching ahead of exploitation is the whole point.
